Proves

Definition 1 (Constants). *Each constant c has type $tc(c)$, such that*

1. $\emptyset \vdash c : tc(c)$
2. if $tc(c) \equiv x : T_x \rightarrow T$ then for all values $v \in T_x$, $[[c]](v)$ is defined and $\emptyset \vdash [[c]](v) : T[x \mapsto v]$.
3. if $tc(c) \equiv \forall \alpha. S$ then for all types τ , if for some T , then **Schema**(T) = τ and $\emptyset \vdash T$, $[[c]][\tau]$ is defined and $\emptyset \vdash [[c]][\tau] : S[\alpha \mapsto T]$.
4. if $tc(c) \equiv \forall p : \tau. S$ then for all values v , if $\emptyset \vdash v : \tau \rightarrow \mathbf{bool}$, $[[c]] @$ is defined and $\emptyset \vdash [[c]] @ : S[p \mapsto v]$.

Lemma 1. *If $e \hookrightarrow e'$ and $\emptyset \vdash e : S_e$ and $\emptyset \vdash e' : S_e$ then $\Gamma \vdash S[x \mapsto e'] <: S[x \mapsto e]$*

ProofIdea. $[[\star]]$ is defined to preserve operational semantics

Lemma 2 (Value Substitution). *If $\Gamma \vdash \rho$ then if $\Gamma; \Gamma' \vdash e : S$ then $\rho\Gamma' \vdash \rho e : \rho S$*

ProofIdea. *Pat-Ming Lemma 10*

Lemma 3 (Type Substitution). *If $\Gamma \vdash \theta$ then if $\Gamma; \Gamma' \vdash e : S$ then $\rho\Gamma' \vdash \theta e : \theta S$*

ProofIdea. ???

Theorem 1 (Preservation). *If $\emptyset \vdash e : S$ and $e \hookrightarrow e'$ then $\emptyset \vdash e' : S$*

Proof. By induction on the typing derivation $\emptyset \vdash e : S$. We split cases on the rule used on the top of the derivation.

- T-SUB

$$\emptyset \vdash e : S \qquad e \hookrightarrow e'$$

By inversion, there exists an S' such that

$$\emptyset \vdash e : S' \tag{1}$$

$$\emptyset \vdash S' <: S \tag{2}$$

By IH and 1

$$\emptyset \vdash e' : S' \tag{3}$$

Which, with 2 and rule T-SUB gives

$$\emptyset \vdash e' : S \tag{4}$$

- T-VAR-BASE, T-VAR, T-CON, T-FUN, T-PGEN and T-GEN cases are trivial, since there can be no e' such that $e \hookrightarrow e'$

- T-APP

$$\emptyset \vdash e_1 \ e_2 : S \qquad e_1 \ e_2 \hookrightarrow e'$$

By inversion, there exist x and T_x such that

$$\emptyset \vdash e_1 : x : T_x \rightarrow T \tag{5}$$

$$\emptyset \vdash e_2 : T_x \tag{6}$$

$$S \equiv T[x \mapsto e_1] \tag{7}$$

– exists e'_1 so that $e_1 \hookrightarrow e'_1$, so $e' \equiv e'_1 \ e_2$

From IH and 5,

$$\emptyset \vdash e'_1 : x : T_x \rightarrow T$$

Which, with 6 and rule T-APP gives

$$\emptyset \vdash e'_1 \ e_2 : T[x \mapsto e'_1] \tag{8}$$

From Lemma 1 we get

$$\emptyset \vdash T[x \mapsto e'_1] <: T[x \mapsto e_1]$$

Which with 8 and T-SUB gives

$$\emptyset \vdash e' : S$$

.

– e_1 is a value, $e_1 \equiv v$

- * exits e'_2 so that $e_2 \hookrightarrow e'_2$, so $e' \equiv v e'_2$
 From IH and 6, $\emptyset \vdash e'_2 : T_x$. Which, with 5 and T-APP gives $\emptyset \vdash e' : S$.
- * e_2 is a value, so $e_2 \equiv v_2$. Since e_1 is a value, it can not be variable, as e_1 is closed, and can not be of the form $\hat{\Lambda}p : \tau.e'$ nor $\Lambda\alpha.e'$, as these values can not have the desired type.
 - $e_1 \equiv \lambda x.e_{11}$, so $e' \equiv e_{11} [x \mapsto v_2]$ By inversion of the rule 5, and if we push the T-SUB rules down in the derivation tree we get

$$x : T_x \vdash e_{11} : T \quad (9)$$

From 6 and WS-EXT we get $x : T_x \vdash [x \mapsto v_2]$. Which, with 9 and Lemma 2 gives $\emptyset \vdash e_{11} [x \mapsto v_2] : T [x \mapsto v_2]$, or $\emptyset \vdash e' : S$.

- $e_1 \equiv c$, so $e' \equiv [|c|](v)$
 By rule 5 and T-CON we have $tc(c) \equiv x : T_x \rightarrow T$. Which, with Definition 1 gives us $\emptyset \vdash [|c|](v_2) : T [x \mapsto v_2]$, or $\emptyset \vdash e' : S$.

- T-INST There exist e_1, S_1, α and τ such that

$$e \equiv e_1 [\tau] \quad S \equiv S_1 [\alpha \mapsto T]$$

By inversion, we have

$$\emptyset \vdash e_1 : \forall \alpha. S_1 \quad (10)$$

$$\text{Schema}(T) = \tau \quad (11)$$

$$\emptyset \vdash T \quad (12)$$

If there exists e'_1 , such that $e_1 \hookrightarrow e'_1$, then $e' \equiv e'_1 [\tau]$. By IH and 10, we have $\emptyset \vdash e'_1 : \forall \alpha. S_1$. This, with 11, 12 and T-INST gives $\emptyset \vdash e'_1 [\tau] : S_1 [\alpha \mapsto T]$, or $\emptyset \vdash e' : S$.

Otherwise, e_1 is a value. From 10 there are two cases:

- $e_1 \equiv \Lambda\alpha.v_1$, so $e' \equiv v_1 [\alpha \mapsto \tau]$. By inverting the rule T-GEN and if we push the T-SUB rules down in the derivation tree, we get

$$\emptyset \vdash v_1 : S_1 \quad (13)$$

By WTS-EXT and 12 we have $\emptyset \vdash [\alpha \mapsto T]$. Which, by 13 and Lemma 3 gives $\emptyset \vdash v_1 [\alpha \mapsto \tau] : S_1 [\alpha \mapsto T]$ or $\emptyset \vdash e' : S$.

- $e_1 \equiv c$, so $e' \equiv [|c|] [\tau]$

By rule 5 and T-CON we have $tc(c) \equiv \forall \alpha. S_1$. Which, with 1 gives us $\emptyset \vdash [|c|] [\tau] : S_1 [\alpha \mapsto T]$, or $\emptyset \vdash e' : S$.

T-PINST There exist e_1, S_1, p and v such that

$$e \equiv e_1 @ \quad S \equiv S_1 [p \mapsto v]$$

By inversion, we have

$$\emptyset \vdash e_1 : \forall p : \tau. S_1 \quad (14)$$

$$\emptyset \vdash v : \tau \rightarrow \mathbf{bool} \quad (15)$$

If there exists e'_1 , such that $e_1 \hookrightarrow e'_1$, then $e' \equiv e'_1 @$. By IH and 14, we have $\emptyset \vdash e'_1 : \forall p : \tau. S_1$. This, with 15 and T-PINST gives $\emptyset \vdash e'_1 @ : S_1 [p \mapsto v]$, or $\emptyset \vdash e' : S$.

Otherwise, e_1 is a value. From 14 there are two cases:

- $e_1 \equiv \hat{\Lambda} p : \tau. v_1$, so $e' \equiv v_1$. By inverting the rule T-PGEN and if we push the T-SUB rules down in the derivation tree, we get

$$p : \tau \rightarrow \mathbf{bool} \vdash v_1 : S_1 \quad (16)$$

$$p \notin \mathbf{FreeVars}(v_1) \quad (17)$$

By WS-EXTand 16 we have $p : \tau \rightarrow \mathbf{bool} \vdash [p \mapsto v]$, also by 17 we get $v_1 \equiv v_1 [p \mapsto v]$ Which, by 16 and Lemma 2 gives $\emptyset \vdash v_1 [p \mapsto v] : S_1 [p \mapsto v]$ or $\emptyset \vdash e' : S$.

- $e_1 \equiv c$, so $e' \equiv [c] @$

By rule 14 and T-CON we have $tc(c) \equiv \forall p : \tau. S_1$. Which, with Definition 1 and 15, gives us $\emptyset \vdash [c] @ : S_1 [p \mapsto v]$, or $\emptyset \vdash e' : S$.

□

Theorem 2 (Progress). *If $\emptyset \vdash e : S$ and e is not a value, then there exists an e' such that $e \hookrightarrow e'$.*

Proof. By induction on the typing derivation $\emptyset \vdash e : S$. We split cases on the rule used on the top of the derivation.

- T-SUB

$$\emptyset \vdash e : S$$

By inversion, there exists an S' such that

$$\emptyset \vdash e : S' \tag{18}$$

$$\emptyset \vdash S' <: S \tag{19}$$

If e is a value, it is trivial, as the assumptions of the theorem are not true. Otherwise, by IH and 18, there exists an e' , such that $e \hookrightarrow e'$.

- T-VAR-BASE, T-VAR, T-CON, T-FUN T-PGEN, T-GEN cases are trivial, since e is a value.
- T-APP

$$\emptyset \vdash e_1 e_2 : S$$

By inversion, there exist x and T_x such that

$$\emptyset \vdash e_1 : x : T_x \rightarrow T \tag{20}$$

$$\emptyset \vdash e_2 : T_x \tag{21}$$

$$S \equiv T[x \mapsto e_1] \tag{22}$$

- e_1 is not a value. From IH and 20 there exists e'_1 so that $e_1 \hookrightarrow e'_1$, so $e' \equiv e'_1 e_2$.
- e_1 is a value, $e_1 \equiv v$
 - * e_2 is not a value. From IH and 21 there exists e'_2 so that $e_2 \hookrightarrow e'_2$, so $e' \equiv v e'_2$
 - * e_2 is a value, so $e_2 \equiv v_2$. Since e_1 is a value, it can not be variable, as e_1 is closed, and can not be of the form $\hat{\Lambda}p : \tau.e'$ nor $\Lambda\alpha.e'$, as these values can not have the desired type.
 - $e_1 \equiv \lambda x.e_{11}$, so $e' \equiv e_{11}[x \mapsto v_2]$.
 - $e_1 \equiv c$. By 20, $tc(c) = x : T_x \rightarrow T$ and by 20 $\emptyset \vdash v_2 : T_x$, so, by Definition 1, $[[c]](v)$ is defined. So, $e' \equiv [[c]](v)$.

- T-INST There exist e_1, S_1, α and τ such that

$$e \equiv e_1[\tau] \qquad S \equiv S_1[\alpha \mapsto T]$$

By inversion, we have

$$\emptyset \vdash e_1 : \forall\alpha.S_1 \tag{23}$$

$$\text{Schema}(T) = \tau \tag{24}$$

$$\emptyset \vdash T \tag{25}$$

- If e_1 is not a value, there exists e'_1 , such that $e_1 \hookrightarrow e'_1$, and $e' \equiv e'_1 [\tau]$.
- If e_1 is a value. From 23 there are two cases:
 - * $e_1 \equiv \Lambda\alpha.v_1$, so $e' \equiv v_1 [\alpha \mapsto \tau]$.
 - * $e_1 \equiv c$. From 24, $tc(c) = \forall\alpha.S_1$. Which, by 24, 25 and Definition 1 gives that $[[c]] [\tau]$ is defined. So, $e' \equiv [[c]] [\tau]$.

- T-PI_{INST} There exist e_1, S_1, p and v such that

$$e \equiv e_1 @ \quad S \equiv S_1 [p \mapsto v]$$

By inversion, we have

$$\emptyset \vdash e_1 : \forall p : \tau. S_1 \quad (26)$$

$$\emptyset \vdash v : x : \tau \rightarrow \mathbf{bool} \quad (27)$$

- If e_1 is not a value, there exists e'_1 , such that $e_1 \hookrightarrow e'_1$, so, $e' \equiv e'_1 @$.
- If e_1 is a value, From 26 there are two cases:
 - * $e_1 \equiv \hat{\Lambda}p : \tau.v_1$, so $e' \equiv v_1$.
 - * $e_1 \equiv c$. From 26, $tc(c) = \forall p : \tau.S_1$, which, by 27 and Definition 1, gives that $[[c]] @$ is defined. So, $e' \equiv [[c]] @$

□

Theorem 3 (Soundness of Decidable Type Checking). *If $\Gamma, P \vdash_{Q,P} e : S$ then $\Gamma \vdash e : S$*

ProofIdea. *By induction on the typing derivation*
